SAMPOS with added Inventory

SAMPOS version 2.1 offers fifteen inventory related reports; three of which focus on reporting stock-on-hand and reordering. One of these reports provides information about inventory levels in terms of "*Overstocked*" items (items whose current-on-hand quantity is more than double the pre-set PAR level).

A second report uses the PAR level plus a pre-set reorder quantity to produce a replenishment report, the final report is a simple stock-on-hand report which includes a total value of the on-hand quantity.

All valuations used the item Unit Cost which can be entered and edited directly into the PLU screen. When new stock arrives the current-on-hand quantity is adjusted by entering a Stock Adjustment. The new cost of the items is entered and compared to the current unit cost – that is, to answer the perennial question "Is my supplier charging me more for the item now then he has in the past?".
